SaaS Bookings & Retention Business Preferences

Bookings, Retention & Adoption Analytics

Document ID	BP-BR-2026-01
Version	1.0
Owner	Chief Revenue Officer
Effective date	1 October 2026
Approved by	Chief Executive Officer
Next review	1 April 2027
Financial year	1 February – 31 January
Classification	Internal – Management Information

1. Purpose and scope

These Business Preferences define the rules, definitions and procedures Welo expects AI agents (including Tableau Agent using Tableau Knowledge) to apply when answering questions about governed data. They apply to all analytical questions answered from published data sources in this domain. Where a preference conflicts with a default interpretation, the preference prevails.

2. How preferences are applied

- **Critical** preferences must always be applied and the basis stated in the answer.
- **High** preferences are applied unless the user explicitly overrides them.
- **Standard** preferences set defaults for terminology, formatting, comparisons and tone.
- If a user asks for an alternative basis, answer as asked and also show the preferred basis.

3. Business preference register

ID	Preference	Rule	Priority
BP-BR-01	“Performance” means gross margin dollars	When a user asks which product, segment, territory or state is “best performing”, “top”, “strongest” or “worst performing”, rank by Gross Margin $ (Net Bookings – Cost of Revenue), not Gross Bookings or Seats Sold. State the basis, then show Net Bookings and margin % for context. Rationale: The business is managed for margin dollars; high-revenue, low-margin lines (e.g. Professional Services) otherwise dominate every leaderboard. Owner: Chief Revenue Officer.	Critical
BP-BR-02	Retention risk flag	Flag any territory, segment or product as **“retention risk”** when Churned ARR exceeds 15% of Net Bookings over the period, or rises more than 1.5 percentage points versus the prior 28 days, or Avg CSAT falls below 4.0. List flagged items ordered by Churned ARR, with discount rate and Net Bookings, and recommend a Customer Success review. Rationale: Churn concentrated in one product or territory is recoverable if caught early. Owner: VP Customer Success.	Critical

BP-BR-03	“Active” means meaningful usage *[Usage]*	An account is active only with at least 5 active users *and* 10+ sessions in the trailing 28 days; a feature is active for an account only if 3+ distinct users used it in that window. Logins alone do not count. State the basis, then show active users, seats licensed and feature adoption %. Rationale: Login counts overstate health. Owner: Chief Revenue Officer.	Critical
BP-BR-04	Low-adoption renewal flag *[Usage]*	Flag any account renewing within 120 days as **“low adoption – at risk”** if seat utilisation is below 40%, fewer than 3 of 5 core features are active (Dashboards, Workflows, Integrations, Reporting, Collaboration), or active users fell more than 20% versus the prior 28 days. Order by ARR at risk and recommend CSM or executive-sponsor intervention. Rationale: Adoption gaps visible 90–120 days out are still recoverable. Owner: VP Customer Success.	Critical
BP-BR-05	Fiscal year and calendar	Fiscal year is 1 Feb – 31 Jan. Quarters: Q1 Feb–Apr, Q2 May–Jul, Q3 Aug–Oct, Q4 Nov–Jan (peak renewal period). Rationale: Aligns with finance close. Owner: Financial Controller.	Standard
BP-BR-06	Currency presentation	All values are US dollars, shown as $ with K/M suffixes. Bookings exclude one-off hardware or pass-through costs. Rationale: Consistent with board reporting. Owner: Head of Finance.	Standard
BP-BR-07	Standard SaaS definitions	Net Bookings = Gross Bookings – Discounts. Discount rate = Discounts ÷ Gross Bookings. Net retention contribution = Expansion Bookings – Churned ARR. Churn rate = Churned ARR ÷ Net Bookings. Seat utilisation = Active Users ÷ Licensed Seats *[Usage]*. Rationale: Single definition across Sales, Customer Success and Finance. Owner: Head of Revenue Operations.	Standard
BP-BR-08	Discount governance	A discount rate above 12% for any territory or product over the period is a “discount breach”. Report it and recommend review by the Pricing Team. Rationale: Protects margin; approved by Pricing Committee. Owner: Head of Pricing.	High
BP-BR-09	Check service health before demand	When bookings or CSAT fall, check Service Incidents and Support Tickets first (a rise of more than 25% versus the prior 28 days indicates a service issue) before attributing the decline to weak demand. Rationale: Service issues explain most unexplained short-term declines. Owner: Head of Support.	Standard
BP-BR-10	Like-for-like segments	Compare territories only within the same Segment (Enterprise, Mid-Market, SMB). Compare states on a per-territory basis. Rationale: Segments have structurally different deal sizes. Owner: Head of Revenue Operations.	Standard
BP-BR-11	Customer satisfaction target	Target Avg CSAT is 4.2 or above on a 5-point scale. Describe results below 4.2 as “below target”. Rationale: Customer Success programme KPI. Owner: VP Customer Success.	Standard
BP-BR-12	Default time comparison	Compare the latest 28 days with the prior 28 days and the same period last year; for Q4 (Nov–Jan) compare only with the same period last year. Rationale: Seasonality distorts sequential comparisons. Owner: Head of Reporting.	Standard
BP-BR-13	No personal information	Do not reveal individual customers, end users or contacts by name or email; report at account, territory and role level only. Rationale: Privacy policy and customer contracts. Owner: Privacy Officer.	High

BP-BR-14	Answer structure	Lead with the number, then the driver, then one recommended action. No more than three bullets. Rationale: Executive readability. Owner: Head of Reporting.	Standard

Highlighted rows are Critical. BP-BR-01 and BP-BR-02 are demonstrated in section 4 using the Bookings & Retention export (last 52 weeks to 31 Oct 2026).

4. Demonstration: effect of the preferences

Question 1: “Which product is our best performing?”

WITHOUT business preferences
Professional Services is the best performing product over the last 52 weeks with net bookings of **$54.8M** (30% of total), followed by Core Platform ($35.6M) and Collaboration ($26.0M).

WITH business preferences applied (BP-BR-01)
Measured on **gross margin $** (net bookings – cost of revenue), **Core Platform** is the best performing product at **$16.3M** (46% margin on $35.6M net bookings). Analytics is second ($10.7M), then Collaboration ($10.4M).
For context, Professional Services leads on net bookings ($54.8M) but earns only $7.7M gross margin (14%), the lowest margin % of the six products.

Question 2: “Where are we at risk of losing customers?”

WITH business preferences applied (BP-BR-02, BP-BR-08)
Core Platform is flagged “retention risk”: churned ARR of **$7.8M** is **21.8% of net bookings**, against 5–12% for every other product. It also carries an **18.6% discount rate**, a discount breach (threshold 12%), and sits at 4.24 CSAT, above the 4.0 flag level.
By territory, New York – Manhattan, Brooklyn and White Plains run churn of about 12% and discount rates of 13–14%; all other territories sit near 10% churn and 8.5% discount.
Recommended action: Customer Success and Pricing Team review of Core Platform discounting and renewals, starting with the three New York metro territories.

What changed: “Best performing” moves from the highest-revenue product (Professional Services) to the highest gross-margin product (Core Platform), and churn and discounting are surfaced as a concentrated risk. Account-level “active” and “low adoption before renewal” answers (BP-BR-03, BP-BR-04) require the Product Usage export.

Answers illustrate expected agent behaviour; all figures are calculated from the Bookings & Retention export (last 52 weeks to 31 Oct 2026). Thresholds are illustrative.

5. Governance and approval

Preferences are owned by the Chief Revenue Officer. Changes require owner approval and a version increment; the register is reviewed six-monthly.
